

Exhibit H

Precisely tuned sonic bristle action creates microbubbles and cleans on contact.

Ultrasound is channeled into the bubbles through a proprietary ultrasound wave guide.

Microbubbles are activated by the ultrasound and transformed into pulsating bubbles.

The Sonic Wave Technology
Innovation Center, www.ultreo.com

The difference is Ultrasound.

Ultreo takes power brushing where it's never gone before. Invented at the University of Washington in association with former scientists, engineers and executives of Optivo Corporation (original developers of the Sonicare® toothbrush), Ultreo is the first power toothbrush to combine ultrasound waveguide technology with precisely tuned sonic bristle action. Ultreo's bristles create microbubbles that are powerfully activated by a proprietary ultrasound waveguide. The result is an incredible, long-lasting feeling of clean.
